

MedTrack

Digital Patient Record System

Abstract

MedTrack: Digital Patient Record System is a web-based application developed to digitize and manage patient medical records efficiently. In traditional healthcare systems, patient information such as prescriptions, treatment history, laboratory reports, and discharge summaries are often maintained in paper form. These records can be lost, damaged, or difficult to access when required, resulting in incomplete medical history during consultations.

The proposed system provides a centralized platform where patient records can be stored and accessed securely. Patients can view their medical history, prescriptions, and uploaded medical documents through a personal dashboard. Doctors can access patient information, review previous treatments, and add new diagnoses and prescriptions to the system. Administrative functions are provided to manage users and maintain records.

The system will be developed using HTML, CSS, and JavaScript for the frontend, Python Flask for the backend, and MySQL for database management. By replacing paper-based records with a digital solution, the system aims to improve accessibility, reduce data loss, enhance healthcare efficiency, and support better medical decision-making.

The project demonstrates the practical application of web technologies and database management in the healthcare sector while providing a secure and user-friendly platform for medical record management.
